Sequence analysis

Sequence analysis

- Next generation sequencing methods have generated large amounts of sequencing data
- **Bioinformatics** uses information from protein and DNA/RNA sequences to derive information about living organisms
- Most bioinformatic approaches are based on sequence comparisons

Sequence comparison/alignment

- You have two sequences THISSEQUENCE and THATSEQUENCE

```
THISSEQUENCE
||||||||||||
THATSEQUENCE
```

- Yet another sequence THATISASEQUENCE

```
TH  IS SEQUENCE
||  || |||||
THATISASEQUENCE
```

or

```
   THIS   SEQUENCE
||||   ||||||||
THATISASEQUENCE
```

Which aligment is the best?- Aligment scoring

- Simplest way is % idendity
- Scoring matrices e.g. Blosum62:

Substitution matrices

- "Various types of substitution matrices have been used over the years. Some were based on theoretical considerations, such as the ***number of mutations that are needed to convert one amino acid into another, or similarities in physicochemical properties***. The most successful, however, use ***actual evidence of what has happened during evolution***, and are based on analysis of alignments of numerous homologs of well-studied proteins from many different species."

Sequence homology – sequences derived from a common ancestor

- Sequences derived from a common ancestor during evolution share sequence similarities, how much is dependent on mutation rate and evolutionary distance

- Sequence homology can imply a common function or structure of a protein

- Sequence identity above 30% over a whole protein sequence is considered a good indication for homology

Blosum and PAM matrices

- PAM uses substitution frequencies from known closely related sequences - PAM matrix number indicates evolutionary distance thus increases with evolutionary distance and sequence divergence

- Blosum use mutation data from highly conserved local regions of sequence – Blosum matrix number refers to percentage identity thus decreases with evolutionary distance and sequence divergence

What about gaps?

- The likelyhood of insertion and deletion mutations is lower than that of point mutations and often result in frame shifts thus gaps receive a penalty the standard is -11
- Insertion and deletions can have different length thus and it is likely that not just a single amino acid got deleted gap extensions thus receive a lower penalty -1

Exercise: Sequence comparison/alignment

- Score the aligment of these two sequences
